

**SNR ball bearing units with cast iron or pressed steel housings**

## SNR ball bearing units - more than just conventional

More than just conventional - not only words for us! Since more than 35 years SNR is a leading manufacturer of ball bearing units and thus has a large pool of experience in various applications for machine and plant construction.

Besides an extensive conventional standard range SNR developed a variety of special custom-built solutions.

That means different surface treatments, as e.g. special painting, zinc or nickel coating, various fixing or sealing systems for the bearing inserts, particular dimensions or housing design - just more than only conventional

In this catalogue you will find the SNR standard range for ball bearing units with cast iron and pressed steel housings.

Housings are made of grey cast iron or sheet steel. The surface of the grey cast iron housings is passivated and painted for protection against corrosion. Pressed steel housings are zinc-plated.

SNR bearing inserts are equipped with forged rings. This forming technology is favourable for bearing life.

The inserts are deep groove ball bearings with spherical outer rings that can compensate misalignment and flexion of shafts to a certain extent. Fixing to the shaft is by means of set screws, eccentric locking collar or adapter sleeve. SNR gives in addition the option for mounting in floating position.

For surroundings with strong contamination bearing inserts with triple lip seal L3 are available.

In addition there is an option to provide grey cast iron housing units with open or closed protective caps made of stainless steel.

The SNR standard range also includes bearing units for high and low temperature.

In case the capacity of the series 200 is not sufficient, the engineer can select different bearing units of the series 300. Here various shaft fixing options are available, too.

In cases, where the customer can't find an appropriate bearing for his application in this catalogue or the catalogues "SNR bearing units of stainless steel" or "SNR bearing units with thermoplastic housings" there still is the option to design a custom-built solution together with SNR.

In those cases please contact one of our sales offices. Finally you will find:

**SNR ball bearing units - more than just conventional.**

## Designation scheme

### Ball bearing units

SNR ball bearing units are defined by the insert, housing type, and shaft diameter.

The insert is described first for SNR ball bearing unit designations (e.g., "UC").

**UCP205**

Next is the specification of the housing type (e.g., "P").

**UCP205**

The first digit describes the diameter series (200 or 300)

**UCP205**

Finally, the code gives the necessary information about the shaft diameter (e.g., "205" = 25 mm shaft diameter).

**UCP205**

Further technical characteristics are described by suffixes (see page 7).

Detailed information about the different housing designs can be found on page 8 and 9 of this catalogue.

### Example

#### Pillow block units

UCP205CC (one closed and one open protective cap)  
UCP205CO (two open protective caps)

#### Flanged units

UCF205CC (one closed protective cap)  
UCF205CO (one open protective cap)

### Bearing inserts

The various inserts of SNR ball bearing units are determined by the initial letters (e.g., "UC")

**UC205**

Detailed information about the different designs can be found on page 16 and 17.

The first digit describes the diameter series (200 or 300)

**UC205**

The last two digits define the bore. The digits are 1/5 of the bore diameter (e.g., "04" = 20 mm, "06" = 30 mm). An exception to this are the smaller bore diameters of 12 to 17 mm.

**UC205**

Bore code	Shaft diameter
01	12 mm
02	15 mm
03	17 mm
04	20 mm
05	25 mm
06	30 mm
:	:
10	50 mm

### inch dimension series

The last two digits are a code for the bore diameter in inches. Exact specifications for diameter can be found in the dimension tables for bearing inserts starting on page 160.

**UC205-16**

## Prefixes and suffixes

---

Prefixes and suffixes	Description
C3	Radial internal clearance larger than normal
C4	Radial internal clearance larger than C3
CC	Closed protective cap made of stainless steel
CO	Open protective cap made of stainless steel with double lip seal
G2	SNR relubrication system
H	Adapter sleeve for bearing inserts with tapered bore
L3	Triple lip seal
M	Metric tapped bore
N	Groove in housing for fixing protective caps
PN	Nickel-plated housing surface
PZ	Zinc-plated housing surface
S	Material stainless steel (Prefix)
T04	Bearing inserts for operating temperatures down to $-40\text{ }^{\circ}\text{C}$
T20	Bearing inserts for operating temperatures up to $+200\text{ }^{\circ}\text{C}$

## Designation scheme

### Housing designs

Design		Description	Dimension lists starting on page
C200		Cylindrical cartridge housing made of grey cast iron, relubricatable	138
C300		Cylindrical cartridge housing made of grey cast iron, relubricatable	138
EHE200		Hanger housing made of grey cast iron with metric fixing threads, relubricatable	146
F200		Square flanged housing made of grey cast iron with 4 fixing holes, relubricatable	72
F300		Square flanged housing made of grey cast iron with 4 fixing holes, relubricatable	72
FA200		Oval flanged housing made of grey cast iron with 1 fixing hole and 1 slot, relubricatable	116
FAE200		Oval flanged housing made of grey cast iron with 1 fixing hole and 1 slot, relubricatable	114
FC200		Round flanged housing made of grey cast iron with centring rim and 4 fixing holes, relubricatable	84
FCE200		Round flanged housing made of grey cast iron with centring rim and 4 fixing holes, relubricatable	80
FD200		Flat oval flanged housing made of grey cast iron with 2 fixing or tapped bores, relubricatable	112
FE200		Square flanged housing made of grey cast iron with 4 fixing holes, relubricatable	68
FEE200		Round flanged housing made of grey cast iron with centring rim and 4 fixing holes, relubricatable	88
FL200		Oval flanged housing made of grey cast iron with 2 fixing holes, relubricatable	100
FL300		Oval flanged housing made of grey cast iron with 2 fixing holes, relubricatable	100
FLE200		Oval flanged housing made of grey cast iron with 2 fixing holes, relubricatable	96
FLZ200		Oval flanged housing made of grey cast iron with centring rim and 2 fixing holes, relubricatable	108
FS300		Square flanged housing made of grey cast iron with centring rim and 4 fixing holes, relubricatable	90
FTE200		Triangular flanged housing made of grey cast iron with 3 fixing holes, relubricatable	94

## Housing designs

Design		Description	Dimension lists starting on page
P200		Pillow block housing made of grey cast iron with 2 slotted holes for fixing, relubricatable	44
P300		Pillow block housing made of grey cast iron with 2 slotted holes for fixing, relubricatable	44
PA200		Pillow block housing made of grey cast iron with 2 tapped bores for fixing from below, relubricatable	64
PAE200		Pillow block housing made of grey cast iron with 2 tapped bores for fixing from below, relubricatable	56
PE200		Pillow block housing made of grey cast iron with 2 slotted holes for fixing, relubricatable	36
PF200		Round flanged housing made of steel plate with 3 or 4 fixing holes, not relubricatable	152
PFE200		Rectangular Take-up housing made of sheet steel with 4 slots for fixing, not relubricatable	158
PFL200		Oval flanged housing made of sheet steel with 2 fixing holes, not relubricatable	154
PFT200		Triangular flanged housing made of steel steel with 3 fixing holes, not relubricatable	156
PG200		Pillow block housing made of grey cast iron with 2 tapped bores for fixing from below, relubricatable	60
PH200		Pillow block housing made of grey cast iron for raised shaft center with 2 slotted holes for fixing, relubricatable	52
PLE200		Pillow block housing made of grey cast iron with 2 slotted holes for fixing, relubricatable	40
PP200		Pillow block housing made of sheet steel with 2 fixing holes, not relubricatable	150
SP200		Conveyor belt tensioner housing made of grey cast iron, relubricatable	132
SPR		Frame for Conveyor belt tensioner housing made of steel	136
T200		Take-up housing made of grey cast iron with taking up for threaded rod and nut, guide groove on both sides, relubricatable	120
T300		Take-up housing made of grey cast iron with taking up for threaded rod and nut, guide groove on both sides, relubricatable	120
WB200		Stretcher frame for T200 take-up housing made of steel	128

## Grey cast iron ball bearing units

### The advantages of SNR grey cast iron ball bearing units

- Corrosion protection by passivated and painted surfaces
- Relubricatable
- Self-aligning
- Series 300 in addition for heavy loads
- Comprehensive standard range of units

SNR bearing units are available as pillow block-, flanged-, take-up-, cartridge or hanger unit. These offer varying options for fixing, such as through bores or tapped bores. All SNR grey cast iron bearing units have tapped bores for the mounting of lubricating nipples.

## Design

### Delivery condition

SNR grey cast iron bearing units are supplied pre-assembled. The fitted insert is lubricated for life (for further information, refer to the section “Lubrication and maintenance” starting on page 34). The tapped bore for mounting of the lubricating nipple is closed with a plastic plug. The appropriate lubricating nipple is separately attached to the unit.

### Misalignment

SNR grey cast iron bearing units are self-aligning, due to their spherically-designed bearing seat. The mounted insert allows an angular movement in all directions. That is why shaft misalignment is compensated up to a certain degree. This self-alignment should only be necessary once, and must not occur permanently in operation.

- if bearing unit should be relubricated  
 $\alpha = \pm 2^\circ$
- if bearing unit should not be relubricated  
 $\alpha = \pm 5^\circ$
- bearing units with protective caps  
 $\alpha = \pm 1^\circ$

## Materials/Surfaces

### Material

SNR cast iron housings, depending on type, are made of quality grey cast iron GG20 or GG25.

### Surfaces

SNR cast iron housings are passivated and then painted in RAL 5010.

Painting in another colour is available on request. There is also the option to get SNR housings zinc or nickel plated.

Would you prefer a custom-built housing?  
Does your application require other materials such as nodular graphite iron or cast steel?  
Should your housing be zinc or nickel plated or do you need your housing in another colour?

Contact us, we have a lot of experience in special custom-built solutions. Flexible production also allows for manufacturing small quantities.

You will be convinced by our short term of delivery times.

**SNR ball bearing units – more than just conventional!**

## Grey cast iron ball bearing units

### Load capacity

SNR housings permit the complete utilization of the bearing insert load rating. The specified radial dynamic load rating of the inserts can be presumed as the maximum radial load capacity of the unit.

For the housings of the T200 and T300 series the radial dynamic load rating must be multiplied by a factor of 0.3.

The maximum axial load capacity of the inserts is  $0.5 \times C_{0r}$  (radial static load rating).

The following safety factors must be taken into consideration for various types of stress:

Type of stress	Safety factor
Constant load	1
Dynamic load	1 – 1.5
Moderate shock load	2
High shock load	> 3

## Radial dynamic load ratings ( $C_r$ ) for inserts of the series UC200 / UC300 / US200 / ES200 EX200 / EX300 / UK200 / UK300

# SNR Ball Bearing Units

## Pressed steel ball bearing units

### Design

SNR pressed steel ball bearing units are available as pillow block-, flanged- or take-up units. The housings are provided with bores for assembly. Pressed steel ball bearing units are not relubricatable.

### Delivery condition

SNR pressed steel housings are supplied pre-assembled. The bearing inserts are lubricated for life. They are attached to the housings.

### Misalignment

SNR pressed steel ball bearing units are self-aligning due to their spherically designed bearing seat. The built-in inserts can be moved in all directions. Shaft misalignment is compensated up to 6 degrees.

Pressed steel bearing units  
 $\alpha = \pm 5^\circ$

## Materials / Surfaces

---

### Material

SNR pressed steel ball bearing units are made of cold rolled sheet steel.

### Surfaces

SNR pressed steel ball bearing units are zinc-plated.

## Load capacity

---

### Maximum load capacity of the housing in radial direction:

Flanged unit:  $C_r \times 0.25$   
Pillow block unit:  $C_r \times 0.10$

### Maximum load capacity of the housing in axial direction:

Flanged unit:  $C_r \times 0.10$   
Pillow block unit:  $C_r \times 0.10$

$C_r$  = radial dynamic load rating of the bearing insert used.

# SNR Ball Bearing Units

## Bearing Inserts

### Designs

The internal design of bearing inserts correspond to the standard deep groove ball bearings of the 6200 and 6300 series. However, they have expanded inner rings for easier fixing on shafts or conical bores for assembly with adapter sleeves.

All bearing inserts are sealed on both sides and are available both with cylindrical as well as with spherical outer rings.

#### UC200/UC300 series (spherical outer ring)

- relubricatable
- extended inner ring on both sides
- fixing to shaft using set screws
- optional design as floating bearing
- seals on both sides with additional slingers
- also available with triple seals

#### CUC200 series (cylindrical outer ring)

- slot in outer ring for fixing in housing by retaining snap ring
- groove in outer ring with lubrication holes
- otherwise, design like UC200

#### US200 series (spherical outer ring)

- relubricatable
- extended inner ring on one side
- fixing to shaft using set screws
- optional design as floating bearing
- seals on both sides

#### CUS200 series (cylindrical outer ring)

- not relubricatable
- groove in the outer ring for fixing in housing using retaining snap ring
- otherwise, design like US200

#### ES200 series (spherical outer ring)

- relubricatable
- extended inner ring on one side
- fixing to shaft using eccentric locking collar
- seals on both sides

#### CES200 series (cylindrical outer ring)

- not relubricatable
- groove in outer ring for fixing in housing by retaining snap ring
- otherwise, design like ES200

## Designs

### EX200/EX300 series (spherical outer ring)

- relubricatable
- extended inner ring on both sides
- fixing to shaft using eccentric locking collar
- seals on both sides with additional slingers
- also available with triple seals

### CEX200 series (cylindrical outer ring)

- groove in outer ring with lubrication holes
- otherwise, design like EX200

### UK200/UK300 series (spherical outer ring)

- relubricatable
- inner ring with tapered bore for mounting of adapter sleeve
- fixing to shaft using adapter sleeve
- seals on both sides with additional slingers
- also available with triple seals

### 6200SEE series (spherical outer ring)

- not relubricatable
- dimensions and tolerances like deep groove ball bearings of 6200 series
- fixing to shaft using fit adjustment
- seals on both sides

## Delivery conditions

SNR ball bearing inserts are supplied ready for use. The inserts are already lubricated for life with a suitable bearing grease. Under normal operating conditions, it is not necessary to relubricate them. The necessary components for fixing the inserts on the shaft are included in the scope of delivery.

SNR ball bearing inserts are either mounted into the respective housing or are supplied separately as bearing insert.

# SNR Ball Bearing Units

## Bearing Inserts

### Materials

Inner and outer rings as well as the balls of the SNR ball bearing inserts are made of hardened 100 Cr6 bearing steel.

Inserts are generally supplied with riveted two-piece steel plate cages.

The seals are made of nitrile rubber and zinc-plated sheet metal.

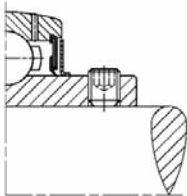

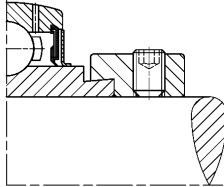

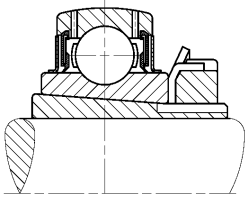

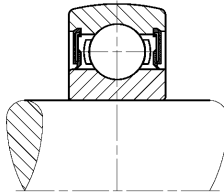

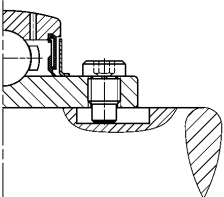

### Fixing to the shaft

One advantage of the SNR ball bearing units are the minimum demands that this type of bearing arrangement makes on the shaft. It must neither be hardened nor ground and the surface quality too has few requirements. We recommend shaft materials having tensile strength of at least  $500 \text{ N/mm}^2$ . The maximal admissible speed is depending not only on the bearing geometry but also on the tolerance of the shaft diameter, as can be seen in the following diagram.

For most applications, threaded pins provide a sufficiently secure fixing of the inner ring to the shaft. For eccentric locking collars, it is recommended to use shafts manufactured according to **h6-h9** for the bearing seats. If tapered adapter sleeves are used, the shaft tolerance **h9** to **h11** is sufficient. If severe operating conditions are encountered, such as vibrations or shocks, a slight interference fit is preferred.

## Options for shaft fixing

Fixing	Features	Application	
hexagon socket set screw	<ul style="list-style-type: none"> <li>• 2 set screws displaced by 120° with hexagon socket and knurled cup point</li> </ul>	<ul style="list-style-type: none"> <li>• normal loads</li> <li>• low to medium speeds</li> <li>• easy to disassemble</li> </ul>	
Eccentric locking collar	<ul style="list-style-type: none"> <li>• Fixing using an eccentric locking collar and hexagon socket set screw</li> </ul>	<ul style="list-style-type: none"> <li>• normal loads with consistent direction of rotation</li> <li>• not suitable for reversing operation</li> <li>• low to medium speeds</li> </ul>	
Adapter sleeve	<ul style="list-style-type: none"> <li>• Tapered adapter sleeve with lock washer and groove nut</li> <li>• Concentric shaft fixing</li> </ul>	<ul style="list-style-type: none"> <li>• higher speeds</li> <li>• suitable for reversing operation</li> <li>• particularly smooth running</li> </ul>	
Fit adjustment	<ul style="list-style-type: none"> <li>• Fixing using shaft fit adjustment</li> </ul>	<ul style="list-style-type: none"> <li>• medium to high speeds</li> <li>• normal to high loads</li> <li>• little structural space</li> </ul>	
Floating bearing screw	<ul style="list-style-type: none"> <li>• Stud bolt in shaft slot, can be moved in the axial direction</li> </ul>	<ul style="list-style-type: none"> <li>• low speeds and loads</li> <li>• large degree of linear expansion (e.g., due to variable temperatures)</li> </ul>	

Exact specifications for the individual fixing options can be found on the following pages.

## SNR Ball Bearing Units

### Operating temperature

Standard ball bearing inserts are suitable for all applications in the temperature range of  $-20\text{ }^{\circ}\text{C}$  to  $+100\text{ }^{\circ}\text{C}$ .

SNR high temperature inserts were specially designed for applications with operating temperatures above the range mentioned previously. They have a steel plate cage like standard inserts. However, they are equipped with a high temperature grease and can be used up to  $+200\text{ }^{\circ}\text{C}$ . The suffix for these inserts is "T20" and is added to the bearing designation on orders, e.g., "UCP206T20".

For applications below the normal temperature range (down to  $-40\text{ }^{\circ}\text{C}$ ), we supply bearing inserts with the designation "T04". They also have a steel plate cage but are filled with a low temperature grease. On orders, the designation is also added to the end, e.g., "UCP206T04".

For further specifications about the lubricants used, refer to the section "Lubrication and maintenance" starting on page 34.

### Bearing clearance

Standard ball bearing inserts are manufactured with an increased bearing clearance of group C3.

Inserts for high or low temperature applications have C4 bearing clearance.

The bearing clearance values can be found in the following tables:

#### Inserts with cylindrical bore

Bore nominal size [mm]		Radial bearing clearance [ $\mu\text{m}$ ]					
		normal		C3		C4	
above	up to	min.	max.	min.	max.	min.	max.
10	18	3	18	11	25	18	33
18	24	5	20	13	28	20	36
24	30	5	20	13	28	23	41
30	40	6	20	15	33	28	46
40	50	6	23	18	36	30	51
50	65	8	28	23	43	38	61
65	80	10	30	25	51	46	71
80	100	12	36	30	58	53	84
100	120	15	41	36	66	61	97
120	140	18	48	41	81	71	114

#### Inserts with tapered bore

Bore nominal size [mm]		Radial bearing clearance [ $\mu\text{m}$ ]					
		normal		C3		C4	
above	up to	min.	max.	min.	max.	min.	max.
24	30	13	28	23	41	32	50

40	50	18	36	30	51	43	68
50	65	23	43	38	61	54	84
65	80	25	51	46	71	64	99
80	100	30	58	53	84	74	114
100	120	36	66	61	97	89	134
120	140	41	81	71	114	109	159

## Axial load capacity of bearing inserts

The axial load capacity of the inserts depends largely on the type of fixing on the shaft. The inner design of the raceways and balls is of little importance in most cases. A further factor is the shaft tolerance used.

In order to attain the largest possible axial load capacity for the respective type of fixing, it is necessary that the fixing element (e.g., threaded pin, adapter sleeve) is secured at the specified tightening torque.

For running conditions with strong vibrations or shock loads it is recommended to set the inner ring against a shaft shoulder and to secure with a groove nut and lock washer as necessary. In this case, the axial load carrying capacity of the inserts can be fully utilised like with standard deep groove ball bearings. This can amount to up to 0.5-times the radial static load rating  $C_{0r}$ . Such an application should be examined closely taking into consideration the respective load conditions.

## Load carrying capacity and speed limits

Load carrying capacity and speed limits of the bearing inserts are specified in the dimension tables starting on page 160. The effect of shaft tolerances on speed limits is shown in the diagram on page 18.

## Life calculation

### Bearing life calculation

The inner design of bearing inserts for SNR ball bearing units are identical to deep groove ball bearings. They are manufactured out of the same material, have the same degree of precision, and are subject to the same strict production controls.

The calculation of bearing life and load ratings are performed using the calculation methods in accordance with ISO 281 and ISO 76.

### Determining bearing sizes

Before calculating the life of bearing units, the loads occurring must be determined. The required bearing size essentially depends on the load and the speed. If the load occurs mostly while the bearing rotates, this is referred to as dynamic load. However, if the load acts mainly during stand still, at very low speeds, or with slight rotating movements, this is referred to as static load.

It is unimportant how the externally applied forces have their effect on the insert. The specification dynamic or static only refer to the operating condition of the bearing.

### Dynamic equivalent load

If both radial and axial forces are applied to a bearing insert, these must be converted to an equivalent load (P) necessary for the calculation, as follows:

$$P = X \cdot F_r + Y \cdot F_a \quad [kN]$$

- $P$  = dynamic equivalent load [kN]
- $F_r$  = actual radial load [kN]
- $F_a$  = actual axial load [kN]
- $X$  = radial factor
- $Y$  = axial factor

$\frac{F_a}{C_{0r}}$	$e$	$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
		$X$	$Y$	$X$	$Y$
0.014	0.19				2.30
0.028	0.22				1.99
0.056	0.26				1.71
0.084	0.28				1.55
0.110	0.30	1	0	0.56	1.45
0.170	0.34				1.31
0.280	0.38				1.15
0.420	0.42				1.04
0.560	0.44				1.00

- $e$  = limiting value
- $C_{0r}$  = radial static load rating  
(see dimension tables for ball bearing units)

## Static equivalent load

For a simultaneously occurring radial and axial static load, an equivalent load ( $P_0$ ) must be determined:

$$P_0 = X_0 \cdot F_r + Y_0 \cdot F_a \quad [\text{kN}]$$

$$\text{but: } P_0 = F_r, \quad \text{if} \quad \frac{F_a}{F_r} \leq 0.8$$

$P_0$  = static equivalent load [kN]

$X_0$  = static radial factor

$Y_0$  = static axial factor

For all bearing inserts, the following applies:

$$X_0 = 0.6$$

$$Y_0 = 0.5$$

Using the ratio  $fs$  it can be checked if sufficient static dimensioning for the insert has been ensured:

$$fs = \frac{C_{0r}}{P_0}$$

Some standard values are:

$fs = 0.7$  minimal demands for running smoothness and rotating movement

$fs = 1.0$  occasional rotating bearing, normal demands for running smoothness

$fs = 2.0$  high demands for running smoothness

It should be noted that this ratio does not provide any assurance against a break or similar, but instead, it is assurance against excessive local deformation in the rolling contact (ball/raceway).

## Calculating bearing life

When calculating bearing life for bearing units, the following applies:

$$L_{10} = \left( \frac{Cr}{P} \right)^3 \quad [10^6 \text{ revolutions}]$$

If the bearing life should be specified in hours, the following applies:

$$L_{10h} = \left( \frac{Cr}{P} \right)^3 \cdot \frac{10^6}{60n} \quad [\text{h}]$$

$n$  = speed [min<sup>-1</sup>]

## Life calculation

### Example calculation

The bearing life of a UCP210 ball bearing unit under the following conditions:

Radial load:	$F_r$	= 2 kN
Axial load:	$F_a$	= 1.7 kN
Normal operating condition speed:	$n$	= 1800 min <sup>-1</sup>
UCP210 ball bearing unit data:	$C_r$	= 35.1 kN
	$C_{0r}$	= 23.2 kN

Dynamic equivalent bearing load:

$$P = X \cdot F_r + Y \cdot F_a \quad [\text{kN}]$$

with  $\frac{F_a}{C_{0r}} = \frac{1.7 \text{ kN}}{23.2 \text{ kN}} = 0.073$  and  $\frac{F_a}{F_r} = \frac{1.7 \text{ kN}}{2 \text{ kN}} = 0.85$

From Table 1:

with  $F_a/C_{0r} = 0.073$ ,  $e$  is determined to be  $\approx 0.28$

with  $F_a/F_r = 0.85 > e = 0.28$

$$\rightarrow X=0.56 \quad Y=1.55$$

$$P = 0.56 \cdot 2 \text{ kN} + 1.55 \cdot 1.7 \text{ kN} = 3.76 \text{ kN}$$

$$L_{10h} = \left( \frac{C_r}{P} \right)^3 \cdot \left( \frac{10^6}{60n} \right) \quad [\text{h}]$$

it follows

$$L_{10h} = \left( \frac{35.1}{3.76} \right)^3 \cdot \left( \frac{10^6}{60 \times 1800} \right) = 7532 \text{ h}$$

The theoretical bearing life of the bearing unit, under normal operating conditions, is 7532 hours.

# Protective caps

## Designs

In order to obtain protection from rotating shafts, increased sealing action, or additional mechanical protection of the bearing units in harsh ambient conditions, it is possible to equip many of the SNR ball bearing units with protective caps made of stainless steel. These are available closed or open with a double lip seal for diameter lines 201 to 213.

SCC – closed protective cap for shaft ends

SCO – open protective cap with double lip seal for through shafts

## Materials

The protective caps are manufactured from stainless steel. The double lip seal is made of silicon rubber.

## Fixing on the housing

There is no need for special tools to assemble the protective caps on the housing. The cap is inserted in a groove in the housing, and is sufficiently secured by the resulting press fit.

**Caution:** Housings with a corresponding groove must be ordered with the specific Suffix “N”, e.g.: “UCP.206.N”

## Protective caps

### Protective cap assembly

---

Protective cap assembly

Protective cap disassembly

### Seals

---

The double lip seal of the SNR protective cap is manufactured from silicon rubber, and is suitable for operating temperatures up to a maximum of +200 °C.

# Units

## Designs

SNR ball bearing units are supplied as a ready-to-fit assembly. If relubrication is necessary, the included lubricating nipple must be mounted.

The spherical bearing seatings of the housings are manufactured in two different ISO tolerances. Bore diameters of up to 180 mm are manufactured in the tolerance class **J7**, which performs a firm seat for the bearing inserts.

Larger bore diameters are manufactured in the tolerance class **H7**. In this cases the insert is secured by a locking pin in the outer ring.

## Assembly

### SNR pillow blocks and inserts with set screw fixing

1. Release set screws and slide bearing unit onto the shaft.

2. Screw down the housing on a flat surface. Mount the housing on the other end of the shaft in the same manner.

3. Screw down the set screws at the recommended tightening torque.

### SNR pillow blocks and inserts with eccentric locking collar

1. Slide the unit onto the shaft. Do not tighten the eccentric locking collar.

2. Tighten the screws slightly. Mount the unit on the other end of the shaft in the same manner. Securely tighten the screws.

3. Preferably tighten the eccentric locking collar by hand in the direction of the shaft rotation.

# SNR Ball Bearing Units

## Assembly

4. Tighten the eccentric locking collar with mandrel and hammer.

5. Tighten the set screws.

## SNR pillow blocks and inserts with adapter sleeve fixing

1. Slide the adapter sleeve onto the shaft.

2. Slide the unit onto the shaft.

3. Align the unit on the shaft, then screw on the housing securely.

4. Mount the lock washer and groove nut and then tighten at the recommended tightening torque.

5. Secure the adapter sleeve (bend the tab of the lock washer into a slot in the groove nut).

## Additional information about assembly

---

In order to prevent possible damage to the bearing insert due to improper assembly, the housing must first be screwed down onto its respective base or onto the frame before the inner rings of the inserts are tightened into their final position on the shaft. Otherwise, undesirable axial distortion could result and thus premature failure of the bearing.

The ends of the shaft should be provided with a chamfer for easier assembly.

It must be ensured that the set screws of the bearing inserts are screwed out far enough so that they do not project in the inner ring bore. Otherwise, assembly can be difficult or the shaft could even be damaged. Normally the bearing inner rings are slid onto the shaft with a tight loose fit. If for individual cases an interference fit proves to be essential, the inner rings should be fit using a suitable piece of pipe, preferably made of brass or plastic.

We also supply the respective assembly tools for all bearing inserts, as well as for standard bearings.

Direct hammer impacts on the inserts or the housing must be avoided because they can damage the bearing.

When assembly is finished, the shaft is initially turned by hand in order to ensure rotation without problems.

In operation, cast iron housings should be stressed by pressure force and not by tension, if possible. Take-up units must be positioned in that way, that the straining screw presses against the housing during adjustment.

Grey cast iron housings are not suitable for highly alternating or axial dynamic loads. In such cases, housings made of cast steel or nodular graphite iron should be used.

Mountings with large bearing spread and bearings which are exposed to additional axial loads because of highly variable temperatures, require special measures, such as mounting a floating bearing screw.

## Securing the housing

---

If exact positioning of the bearing unit is required, some of the housing types can be secured using available centring, or straight or tapered pins.

Housing types with possible positions of the pin bores can be found in the tables starting on page 190.

# SNR Ball Bearing Units

## Lubrication and maintenance

SNR ball bearing units are filled with the required amount of grease at the factory. Thus additional lubrication during assembly is not necessary.

Relubrication is not necessary for normal operating conditions.

Under severe conditions, such as continuous operation at high speeds, high temperatures (above  $+70^{\circ}\text{C}$  operating temperature), heavy loads, or very humid or dirty surroundings, regular relubrication is necessary.

Relubrication is dependent on the insert size. Relubrication should be performed during operation (rotating insert under operating temperature). Press the suitable grease into the unit until a fresh collar of grease is formed on the seals.

**Caution:** The old grease must be allowed to emerge without hindrance.

## Relubrication system

Grey cast iron housings are equipped with a lubrication groove within the spherical bore. The inserts have 4 lubrication holes in the outer ring which are arranged offset.

Because of the arrangement of the lubrication holes, SNR inserts can be mounted in nearly all housings with lubrication groove and then be relubricated.

## Lubricating nipple

The lubricating nipple used is made of steel and is zinc plated.

The following sizes of the lubricating nipple are used:

**M6x1, M8x1, M10x1 and R1/8"**

Specifications about suitable lubricating nipples for individual housings can be found in the dimension tables.

**Delivery condition:** Lubricating nipples are supplied together with the bearing units. They are not mounted. The lubrication hole in the housings is closed with a plastic plug.

## Grease

SNR ball bearing inserts are lubricated for life at the factory. If relubrication is necessary because of severe operating conditions, grease having the same base and consistency should be used.

The greases for SNR ball bearing units have the following technical characteristics:

Range of application for grease	Grease base	Temperature range [°C]	Consistency DIN 51 818 NLGI class	Speed characteristic (n · dm) [min <sup>-1</sup> · mm]	Viscosity at 40°C [mm <sup>2</sup> /s]
Standard	Lithium soap	-20 to +120	II	500 000	100
High temperatures (e.g., "T20")	Perfluorpolyether oil and PTFE	-40 to +260	II	300 000	400
Low temperatures (e.g., "T04")	Lithium soap	-60 to +120	III	–	25

\* = Equipped with two open protective caps for passing shafts: Suffix CO see example on page 6

\*\* = Equipped with one open and one closed protective cap for shaft ends: Suffix CC see example on page 6

\*\*\* = Protective cap for bearing inserts with eccentric locking collar at request

80	120	0	+28	28	-200	0
120	140	0	+33	35	-250	0

$\Delta d_{mp}$  = Allowance of the average bore diameter in a single plane

$\Delta D_{mp}$  = Allowance of the average outer diameter in a single plane

$K_{ia}$  = Radial runout of the inner race in an assembled bearing bearing insert

$K_{ea}$  = Radial runout of the outer race in an assembled bearing bearing insert

$\Delta B_s$  = Allowance of a single inner race width

## Tolerances of edge clearances

Nominal size of edge clearance e1 [mm]	Bore diameter [mm]		e1 <sub>min</sub> [mm]		e1 <sub>max</sub> [mm]	
	over	incl.	radial	axial	radial	axial
0,6		40,0	0,6	0,6	1,0	2,0
1,0		50,0	1,0	1,0	1,5	3,0
1,1		120,0	1,1	1,1	2,0	3,5
1,5		120,0	1,5	1,5	2,3	4,0
2,0		80,0	2,0	2,0	3,0	4,5
	80,0				3,5	5,0
2,5		100,0	2,5	2,5	3,8	6,0
3,0		280,0	3,0	3,0	5,0	8,0
4,0			4,0	4,0	6,5	9,0

## Tolerance of tapered bore

Nominal diameter d [mm]		Deviation			
		$\Delta d_{mp}$ [ $\mu\text{m}$ ]		$\Delta d_{1mp} - \Delta d_{mp}$ [ $\mu\text{m}$ ]	
over	incl.	min.	max.	min.	max.
18	30	0	+33	0	+21
30	50	0	+39	0	+25
50	80	0	+46	0	+30
80	120	0	+54	0	+35
120	180	0	+63	0	+40

- $\alpha$  = Nominal angle of taper =  $4^{\circ}46'18,8''$   
 $\alpha/2$  = Angle of inclination at end of cone =  $2^{\circ}23'9,4''$   
 $\Delta\alpha/2$  = Deviation of angle of inclination =  $1,716 \cdot \frac{\Delta d_{1mp} - \Delta d_{mp}}{B}$  [minutes]  
 B = Width of inner ring  
 d = Nominal bore diameter  
 $d_1$  = Bore diameter at large cone end =  $d + 0,083333 \cdot B$   
 $\Delta d_{mp}$  = Deviation of average bore diameter in a single plane  
 $\Delta d_{1mp}$  = Deviation of bore diameter  $d_1$

# Custom-built bearing units

## Designs

The SNR standard range of ball bearing units includes a large number of various types in e.g. different shapes and materials. In case the presented standard solutions are not sufficient for a special application, SNR can design a particular solution.

SNR already met the special requirements of numerous customers by manufacturing bearing units in multiple variations with special materials, as e.g. cast iron or steel casting, special surface treatments, as e.g. zinc or nickel coating, or special shapes adapted to narrow spaces. A flexible production enables us to manufacture small quantities with short time of delivery.

SNR has years of experience in realization of special solutions. In the following you find a small selection of special ball bearing units designed in cooperation with our customers.

## Examples

## SNR ball bearing unit range

### Corrosion-resistant SNR ball bearing units with thermoplastic housings

The ball bearing units presented in this catalogue are composed of housings made of Thermoplastic PBT and bearing inserts of stainless or chrome steel.

The units can be equipped with protective caps of SR50 (Polypropylen), open with 2-lip seal for passing shafts or closed for shaft ends..

The bearing units are used, among other areas, in the food- and pharmaceutical industries with their high demands for hygiene and corrosion resistance of the material used. For this reason all bearing units are lubricated with grease in accordance with the USDA H1 standard. Currently this standard places the most stringent requirements on the hygiene and purity of the materials used in the lubricant.

### SNR ball bearing units of stainless steel

SNR ball bearing units made of stainless steel are used, among other areas, for applications with high requirements for the corrosion resistance of the components.

In these applications with severe operating conditions, as e.g. high humidity or direct contact with aggressive media, conventional bearing units meet the requirements insufficient or not at all.

SNR takes these special applications into account with an extensive standard range of ball bearing units made of stainless steel.

Furthermore SNR meets the requirements of the pharmaceutical- and food-industries according to USDA H1 (high purity of the raw materials used in the lubricant) by filling all inserts of SNR stainless steel bearing units exclusively with grease according to this specification.
